

DRUM BOTTOM SAMPLER

velcon
CANADA

Fuel bottom only samples can now be achieved with this easy to use device.

The bottom sampler will capture a sample directly from the bottom of the fuel drum where water and particulate accumulate. Easy to use with just a simple press of the top plunger will open the bottom valve allowing the fuel head pressure to force the drum bottoms up inside the sampler tube. No product will enter the sampler as the sampler is lowered into the drum and no product is lost from the sampler until the plunger is opened allowing recovered product into the sample jar.

- Aluminum light weight construction
- Recovers approximately a 500 ml sample from a full drum (other capacities available)
- Design allows samples to be taken at any level of the fuel as desired
- Can also be used as a dipstick with water finding paste when sampling
- Part #990483
